PROBLEMS FORMULATION

How is the point cloud registration analysis resulting from combining data from TLS and UAV?

How is the qualitative analysis of the results of the visualization of the 3D model of Candi Plaosan Lor in Augmented Reality?

RESEARCH OBJECT

NORTH OF PLAOSAN TEMPLE

The location of this research is Plaosan Lor Temple which located in Plaosan Hamlet, Bugisan Village, Prambanan District, Klaten Regency, Central Java. The object of this research is one of the main temples in Plaosan Lor Temple.

RESEARCH METHODOLOGY

Preparation Phase

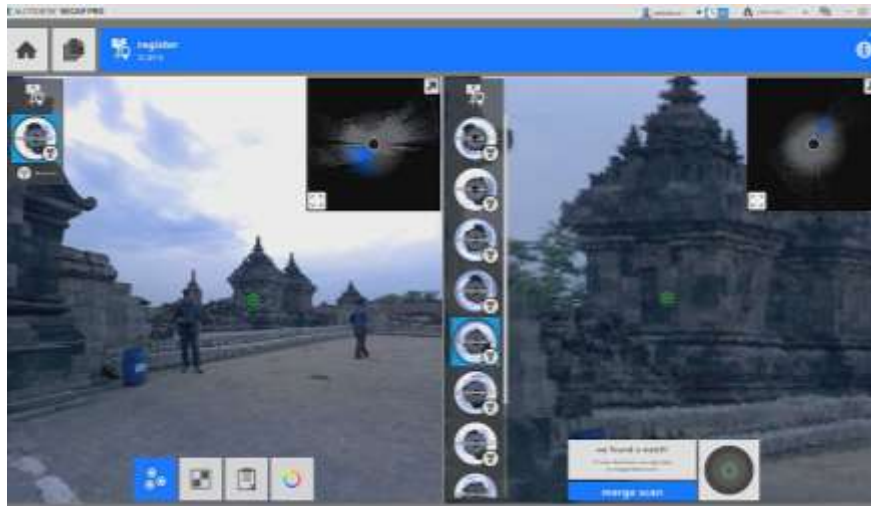

Implementation Phase

Analysis Phase

TLS DATA

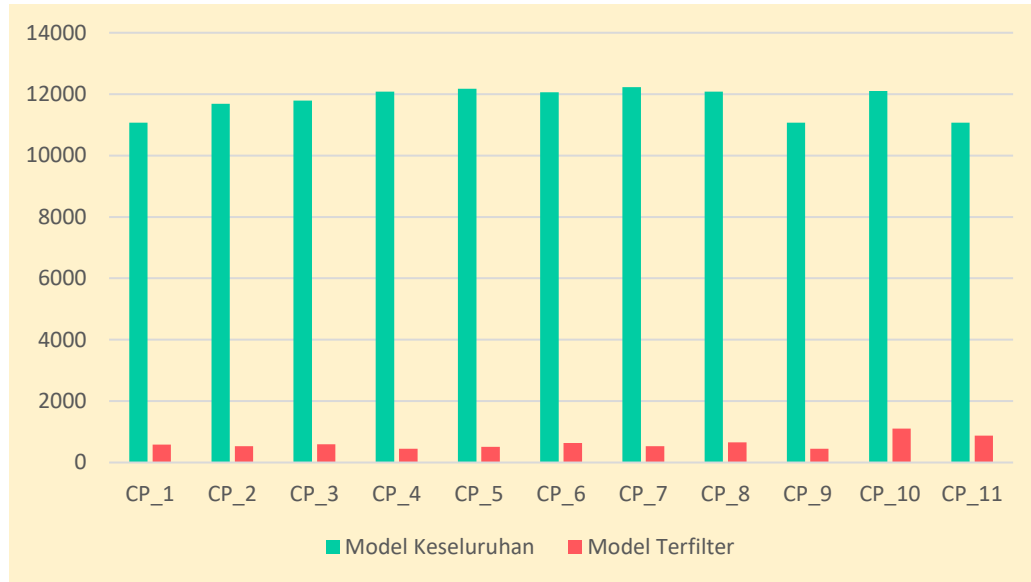

CLOUD TO CLOUD

This registration uses a minimum of 3 points that are owned from the two scans. The purpose of this concept is to find the offset or the closest distance repeatedly from the two closest points between the two cloud point sets.

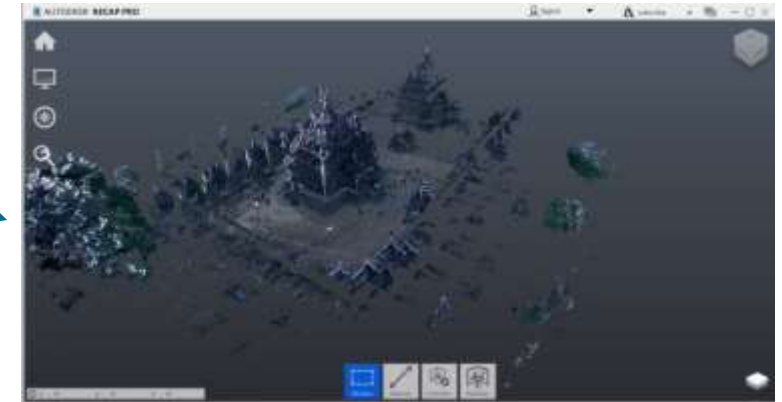

11 tool stands with a maximum distance of 2m between points

CLOUD POINT REDUCTION
 from 129,429,314 points to only
 7,198,274 points

FROM THIS

TO THIS

UAV DATA

The data is generated from the Mavic 2 Pro hardware with a flying height of 100m with 80% overlap and 40% sidelap. There are 430 numbers of aerial photographs produced.

CLOUD POINT REDUCTION
from 24,180,212 points to only 440,684 points

ALIGNMENT DATA

POIN CLOUD UAV				
NO.	X	Y	Z	ERROR

R4	14.402279	-12.150108	-0.653858	0.0119344
R5	14.919536	-15.083216	-0.635958	0.015897
R6	8.203098	-12.962484	-0.616918	0.0339328
Total RMS error				0.0320501

This RMS value is taken from the alignment error value remaining between each pair after registration. So that the combined RMS value of the two is 0.0320501 m or about 3 cm. The RMS value has a good index. The combined point cloud has a total of 7,636,895 points.

SURFACE RECONSTRUCTION

Poisson surface reconstruction is a plugin that generates a mesh piling algorithm created by Misha Kazhdan of Johns Hopkins University.

The process of building a model using this plug-in must enter a normal value which is sure to be clean from noise.

Apart from being a 3D form, the output can also include density information to get a more valid mesh.

MODEL 3D
From UAV data

Model 3D from UAV data has 1.664.083 faces

MODEL 3D
From TLS data

Model 3D from TLS data has 12.959.39 faces

MODEL 3D
From COMB data

Model 3D from Combination of both data has 14.206.094 faces

AR BUILDING

Design of application

- Unity implements global coordinates based on its software. That is, Unity has its own coordinates in its world.
- The target is set with a scale of 1: 1: 1.
- The model scale adjusts according to the target with a scale of 4: 4: 4.

AR BUILDING *Qualitative Test*

Qualitative test on the 3D model in AR using 5 samples from each model

CONCLUSION

01. TLS has a point cloud of 7,198,274 larger points than UAV with 440,684 points. Registration of combined point cloud data TLS and UAV refers to data that has more points. TLS data becomes a reference for UAV data. The registration resulting from combining the two data uses 7 tie points with an average error of 0.0320501 m.
02. This research produces 3 different 3D models of Plaosan Lor temple based on the data source. The 3d model created from TLS data generates 12,959.39 faces, UAV data generates 1,664,083 faces, while combining the two data results in 14,206,094 faces. The three of them are displayed through virtual media with an AR design. The results of the qualitative test of the three models used 5 samples of the part of the model in AR and their appearance in the field. As a result, the combined model has better quality among other models, because the TLS and UAV data fill each other's gaps. However, with an efficient process in terms of time, cost and energy, the UAV model can roughly represent the temple. Meanwhile, TLS is not recommended to analyze the temple as a whole, but if the need is only for the analysis of the temple side of the temple, this vehicle is suitable for use.
